                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AGATATTTTCAGACTATCAG 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The termination codon of subunit A2 overlaps the initiation codon of subunit B by 4 bp. The correct translation of the 2 subunits is the result of a shift in reading frames at this junction. Previous protein structural analysis has shown that the A2 subunit is bound to a precursor of the A subunit. Therefore, the 'met' at position is not an initiator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Vibrio cholerae toxA and toxB genes

                                                                                                                                                                                                                                                                                                                                                                           AAN50205 is the gene sequence of the natural LTA gene. The LTA gene the site directed mutant SDM1 (see AAN50206) is inactive. The inventors claim a vaccine prepn. active against pig scours which contains an inactivated LTA component, together with additional K88 antigens opt. with whole cells comprising the antigens or contg. the inactivated LTA.

The LTA gene the site directed mutant SDM1 (see AANSO206) is inactive. The inventors claim a vaccine prepn. active against pig scours which contains an inactivated LTA component, together with additional K88 antigens opt. with whole cells comprising the antigens or contg. the inactivated LTA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cc are two novel detoxified and immunologically active proteins (LT mutants) derived by site-directed mutagenesis of the Al subunit of wild ctype LT. The substitution of Ser to Tyr at position 63 in LTS63v blocks cc NAD-binding. Deletion of Glu residues at positions 110 and 112 in ctide of the Al subunit of Cc wild type LT catalyses ADP ribosylation of Gs, a GTP-binding protein that cregulates camp levels. The resulting increase in cAMP is the cause of Cc diarrhoea in humans and animals e.g. pigs. The mucosal immunogenicities cof mutant heat-labile endotoxins LTS63v and LTdell110/112 were tested. CC froups of mice were immunised with LTS63v and LTdell110/112. The control CC groups received phosphate buffered saline (PBS) alone. The serum and CC mice immunised with LTS63v or LTdell110/112 contained high and CC comparable level of anti-LT antibodies in sera and faecal extracts compared with those immunised with wild-type LT. The LT mutants are CC useful as a vaccine for preventing and treating diarrhoea and as an antibody production.

                                   The thermolabile toxin (LTh) gene sequence is derived from enterotoxigenic E. coli. An LTh-STla-STlb probe, wherein all all or part of the sequences of the three toxin genes represented in AAQ23864-66 are ligated to each other by T4DNA ligase, may be to for the detection of Vibrio cholerae and enterotoxigenic E.coli simultaneously in a simple way.

The method has the same sensitivity as the dangerous radio-isotope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     718

                                                                                       This plant-codon optimized cDNA encodes a synthetic Escherichia coli
(heat-labile toxin (LT) A subunit (LT-A). The sequence contains
plant-preferred codons and eliminates sequence motifs associated with
spurious mRNA processing. A single codon insertion (GTG encoding valine)
was made to accomodate the creation of a NcoI restriction site around the
initiator methionine codon. Novel polynucleotides encode a mutant LT-A
(CT-A) polypeptide or a mutant Vibrio cholerae cholera toxin (CT) A subunit
(CT-A) polypeptide, which have reduced enzyme activity as compared to the
wild-type LT-A or CT-A polypeptide and where at least one of the codons
is altered to a plant preferred codon. The polypucleotide further
comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B
subunit (CT-B). The polypucleotides are useful for the transformation of
plant cells for the production of transgenic plants to produce edible
vaccines, especially oral vaccines in transgenic plants for the
prophylactic or therapeutic treatment against E. coli or V. cholerae. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           elicit immune responses in animals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polynucleotides encoding LT-A or CT-A polypeptides for the transformation of plant cells, useful in immunogenic compositions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 2000-442653/38

```
the initiator methionine codon. Novel polynucleotides encode a mutant LIT-A polypeptide or a mutant Vibrio cholerae cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible vaccines, especially oral vaccines in transgenic plants for the prophylactic or therapeutic treatment against E. coll or V. cholerae. The mutant polypeptides are also useful as adjuvants. Note: This sequence does not appear in the specification. It was constructed from the wild type LT-A CNNA shown in AAA51106 which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This cDNA encodes a mutant S63K Escherichia coli heat-labile toxin (LT) A subunit (LT-A). The codon at nucleotide positions 246-248 was changed from the wild-type TCC to AAG which causes a change of serine to lysine in the mature protein at residue 63. The sequence contains plant-preferred codons and eliminates sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding valine)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               transformation of plant cells, useful in immunogenic compositions elicit immune responses in animals % \left( 1\right) =\left\{ 1\right\} =\left\{ 1\right

                                                                        This cDNA encodes a mutant A72R Escherichia coli heat-labile toxin (LT) CC A subunit (LT-A). The nuclectides at position 273-274 were changed from the wild-type GC to AG which causes a change of alanine to arginine in CC the mature protein at residue 72. The sequence contains plant-preferred codons and eliminates sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding valine) was made to accomodate the creation of a NGOI restriction site around the codo codon entiator methionine codon. Novel polynucleotides encode a mutant LT-A collypeptide or a mutant vibrio cholerae cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further CC comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edble corphylactic or therapeutic treatment against E. coli or V. cholerae. CC more constructed from the wild type LT-A cDNA shown in AAA51106 which is constructed from the wild type LT-A cDNA shown in AAA51106 which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polynucleotides encoding LT-A or CT-A polypeptides for the transformation of plant cells, useful in immunogenic compositions elicit immune responses in animals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        mat_peptide

                                                                          Percent Similarity:
                                                                                                                                                                                                         initiator methionine codon. Novel polynucleotides encode a mutant LT-A polypeptide or a mutant Vibrio cholerae cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible vaccines, especially oral vaccines in transgenic plants for the prophylactic or therapeutic treatment against E. coli or V. cholerae. The mutant polypeptides are also useful as adjuvants.

Note: This sequence does not appear in the specification. It was constructed from the wild type LT-A CDNA shown in AAA51106 which is
                                                                                                                                                                                                                                                                                                                                                                                                         This cDNA encodes a mutant R192G Escherichia coli heat-labile toxin (L7 A subunit (LT-A). The nucleotide at position 631 was changed from the wild-type A to G which causes a change of arginine to glycine in the mature protein at residue 192. The sequence contains plant-preferred codons and eliminates sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding valine) was made to accommodate the creation of a NcoI restriction site around the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mat_peptide

The present sequence encodes for Escherichia coli heat-labile centerotoxin (LT) mutant LTdell10/112. LTS63Y (ABU00506) and LTdell10/112 CC are two novel detoxified and immunologically active proteins (LT cutants) derived by site-directed mutagenesis of the Al subunit of wild type LT. The substitution of Ser to Tyr at position 63 in LTS63Y blocks (LT catalyses) Deletion of Glu residues at positions 110 and 112 in CC LTdell10/112 eliminate the enzymatic activity of LT. The Al subunit of CC wild type LT catalyses ADP-ribosylation of Gs. a CTP-binding protein that CC regulates CAMP levels. The resulting increase in cAMP is the cause of CC diarrhoea in humans and animals e.g. pigs. The mucosal immunogenicities CC of mutant heat-labile endotoxins LTS63Y and LTdell10/112 were tested. CC croups of mice were immunised with LTS63Y or LTdell10/112. The control CC groups received phosphate buffered saline (PBS) alone. The serum and CC mice immunised with LTS63Y or LTdell10/112 contained high and CC comparable level of anti-LT antibodies in sera and faceal extracts comparable level of anti-LT antibodies in sera and faceal extracts are useful as a vaccine for preventing and treating diarrhoea and as an cafiunant for antibody production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New detoxified mutants of Escherichia coli heat-labile enterotoxin useful as vaccine for preventing and treating diarrhoea, and as adfor antibody production \,\cdot\,

The sequence was published by Yamanoto et al, J.Biol. Chem., 259, 5037-5044. Mutations at selected positions within this sequence have been to reduce toxicity (see AAQ51314-Q51326). The invention relates immunogenic, detoxified LT-A proteins and their use in vaccines protect against enterotoxigenic E.coli.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                prior/subsequent to the antigen, and is preferably administered within a short space of time to the same site; it can also be administered in isolation from antigens as a boost following systemic or mucosal antigen administration. Most preferably, the adjuvant is co-administered with the antigen in the compositions and a pharmaceutically acceptable carrier. The antigen may be derived from viruses, bacteria, parasites and fungi or may be tumour antigens, self-antigens and allergens. The compositions are therefore useful in the treatment and prevention of e.g. viral diseases, allergic manifestations, diseases caused by pathogens (e.g. bacteria or parasites), AIDS, autoimmune diseases (e.g. Systemic Lupus Erythematosus), Alzheimer's disease and cancers. The adjuvant can also be used to prepare antibodies against selected antigen(s), useful e.g. for diagnostic purposes or for antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        E. coli heat labile toxin, an example of a bacterial ADP-ribosylating toxin. A mutant detoxified form of this protein is used in a parenters adjuvant composition, which comprises the detoxified protein, at least one selected antigen and optionally a pharmaceutically acceptable (optionally topical) vehicle. The adjuvant composition can be administered parenterally in conjunction with at least one antigen in methods to immunise vertebrate subjects. The adjuvant has the ability to enhance the humoral and cell-mediated immune responses elicited by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           151
The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al. J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected tite-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to
                                                                                                            Claim 3;
                                                                                                                                            Immunogenic detoxified mutant cholera toxin and heat labile toxin - useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 enterotoxigenic bacteria; vaccine; immu protomer A; site-directed mutagenesis; ADP-ribosyltransferase activity; ss.
                                                                                                                                                                                                                                                                                                                                                 31-DEC-1991;

Sequence AAQ51317 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino acid numbering is based on the cholera toxin A subunit sequence).

                                                                                                                                                                                                                                                                                                                                                                     The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51325 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino acid numbering is based on the cholera toxin A subunit sequence).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Immunogenic detoxified mutant cholera toxin and heat labile toxin useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             enterotoxigenic bacteria; vaccine; immunogenic protomer A; site-directed mutagenesis; reduced ADP-ribosyltransferase activity; ss.

                                                                                                                                                                                                                                                                                                                                                       Percent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yanamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51326 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino primer sequence used to introduce the preferred mutation. (Amino primer sequence used to introduce the preferred mutation. (Amino primer sequence used to introduce the preferred mutation.)
